

React JS

Developer RoadMap

Manzer Ansari

📷 @bug_and_debug

Core Concepts

JSX – Write HTML in JS

Components – Reusable building blocks

Props & State – Manage and pass data

Conditional rendering & Lists

Manzer Ansari

 @bug_and_debug

Master Hooks

useState, useEffect, useRef
useCallback, useMemo
useReducer – Complex state
useContext – Global state

Manzer Ansari

 @bug_and_debug

State & Data Handling

React Router - Routing

Context API / Redux Toolkit

React Query - Data fetching & caching

Axios - API requests

Zustand / Jotai - Lightweight global state

Manzer Ansari

 @bug_and_debug

UI & Styling

Ant Design / MUI / Chakra UIContext

Tailwind CSS - Utility classes

Styled Components / Emotion - CSS-in-JS

Manzer Ansari

 @bug_and_debug

Forms & Validation

TypeScript – Static typing

Next.js – Fullstack React framework

SWR / TanStack Query – Smart fetching

React DevTools – Debug components

Manzer Ansari

 @bug_and_debug

Testing & Deployment

React Testing Library / Vitest
GitHub Actions / Vercel / Netlify
ESLint & Prettier – Clean
codeStorybook – Component testing
Performance tuning – Lazy loading,
memoizing

Final Word: What Should You Focus On?

You don't need to master everything at once. Start with **strong React fundamentals** – components, props, state, and hooks. Then slowly move into **routing, state management, and API handling**. Tools and libraries will change, but **thinking in React** and writing clean, maintainable code will always matter most.
