REACT INTERVIEW MASTERY

What is React?

1. WHAT is it?

- React is an open-source JavaScript library created by Facebook.
- Its main job is to build User Interfaces (UI).
- It breaks down a whole website into small, manageable pieces called Components.

2. WHY use it?

 Speed: Uses the Virtual DOM (Only updates the parts that change).

 Reusability: Build a "Button" or "Navbar" once, reuse it everywhere.

N Job Market: High demand! Companies like Netflix,  

3. HOW does it work?

- Follows a Declarative approach.
- Describe how the UI should look based on the current "State".
- React automatically updates the browser.
- Uses JSX (JavaScript XML) - A mix of HTML & JS.

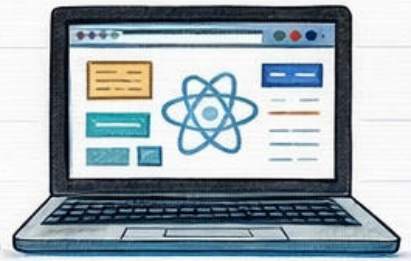

4. WHERE to use it?

- Single Page Applications (SPA).
- Large Scale Web Apps (e.g, Social Media Feeds).
- Mobile Apps: React Native for Mobile Development.

Role of React in Software Development

1. WHAT is its Role?

- In software development, React acts as the "View Layer"
- Its primary job is to handle everything the user sees and interacts with on the screen.
- It takes data from the backend and turns it into a beautiful, interactive user interface (UI).

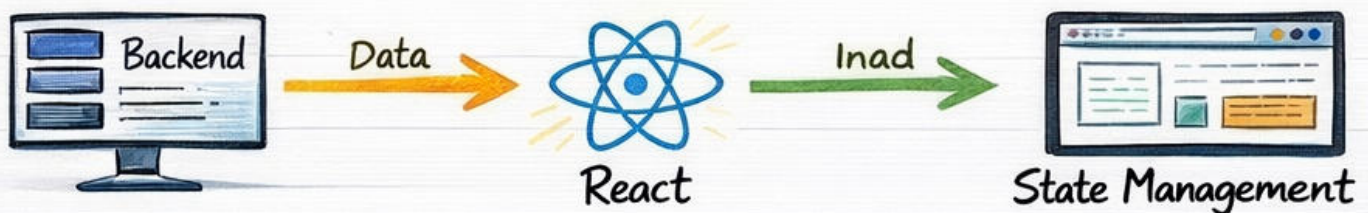

2. WHY is it important?

-  **Simplifies Complexity:** In old methods (Vanilla JS), updating the UI was messy. React simplifies this by automatically updating the screen whenever the data changes.
-  **Consistency:** Since the app is divided into small components, the design stays consistent across the entire website.
-  **Faster Development:** Because components are reusable, developers can build large apps much faster than before.

3. HOW does it fit in the Workflow?

- React doesn't work alone; it is the "Front" of the house.

4. WHERE is it used in the lifecycle?

- ✓ **Prototyping:** Used to quickly build a working model (MVP) of an app.
- ✓ **Scaling:** When an app grows from 10 users to 1 million, React's structure makes it easy to manage.
- ✓ **Collaboration:** It allows multiple developers to work on different components (like one on the Navbar, one on the Footer) at the same time without breaking Each other's code.
